

PEARLY IRIDESCENT WAX

Product Description

This Pearly Iridescent Wax is a natural Metallic Decorative Wax that contains very fine mica to give a subtle finish. Applied to any surface(s) it works as a protector as well as enhancing its appearance with a very light iridescence. It is perfect when applied onto smooth polished plasters and is best applied to lime-based products as it is 100% solvent-free.

Application Instructions

Stir Well before use. The wax should be applied to the surface using a fine polishing cloth and ensuring an even application. Allow it to dry completely, then use a lambswool bonnet to buff the surface until you achieve the desired result.

Surface Preparation

Make sure the surface is completely dry, dust free and all impurities have been removed. If the wax is slightly hardened, it can be placed near a heat source until it becomes “creamy” again.

Cleaning of Tools

The cloth does not need to be cleaned and can be allowed to dry ready for next use.

Technical Specifications

15-30 sqm/L depending on the thickness of the application and absorption of the surface.

Recommendations

Best not to apply on to larger grain or textured plasters, as the wax cannot be evenly applied and will result in a build up in certain areas of the plaster.

Storage

Storage temperature: 5 – 30C. Should be used preferably within 2 years from the date of the purchase, and should be stored in the original container, under the appropriate temperature conditions.
